Data Structures & Algorithms

Stack Abstract Data Type

Dr. Jason King

```
Algorithm goPack(S)
Input a Stack of students
Q ← a new queue
while !isEmpty(S)
  x ← pop(S)
  grade(x) ← A
  enqueue x
while !isEmpty(Q)
  dequeue(Q)
```

N	C	S	T	A	T	E
0	1	2	3	4	5	6

$$h(k) = (\alpha \times f(k) + \beta) \bmod m$$

Raxix sort

```

00110011 00110001 00110110
00100000 01001001 01010011
00100000 01010100 01001000
01000101 00100000 01000010
01000101 01010011 01010100
```

DEFINITION

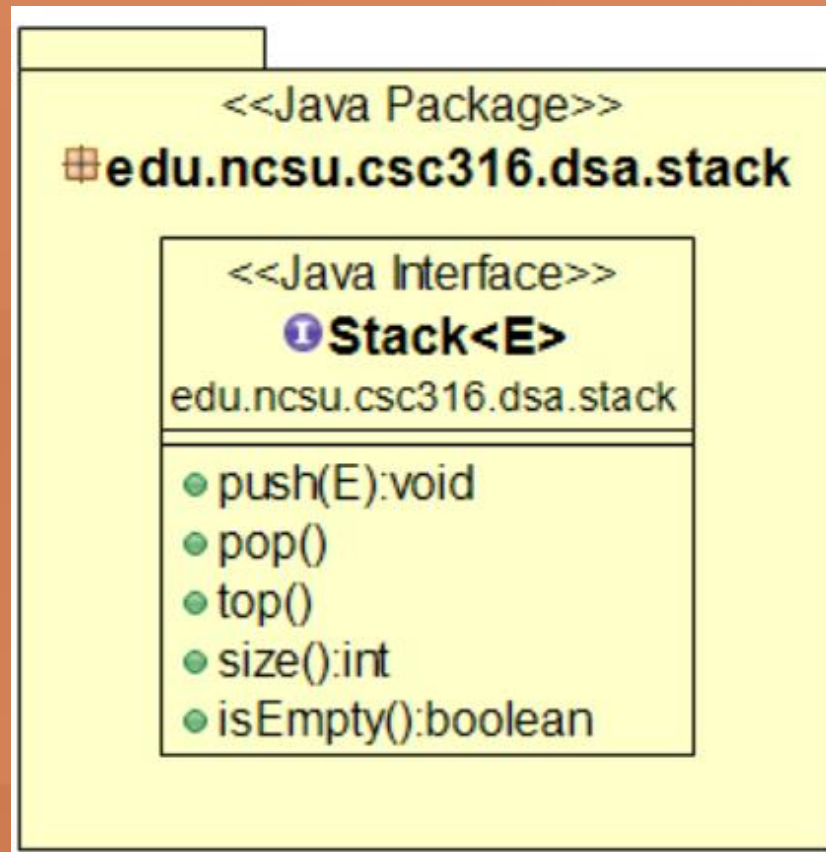

Stack

- Collection of data, where the last value inserted is the first value removed
- LIFO (last-in-first-out)
- Values can only be inserted or removed from the top of the stack

ABSTRACT DATA TYPE

Operation	Description
push(e)	Adds the element to the top of the stack
pop()	Removes and returns the element at the top of the stack
top()	Returns, but does not remove, the element at the top of the stack
size()	Returns the number of elements in the stack
isEmpty()	Returns true if the stack is empty; otherwise, returns false

ABSTRACT DATA TYPE

Stack with a Singly Linked List

- Top element stored at the head of the list
- **push(o)**: insert at the head →
- **pop()**: remove at the head →

Array-based Stacks

- Use an array of size N
- Add elements from left to right
 - Why?
- Variable *top* keeps track of the index of the top element

Array-based Stack Operations

Given:

- an array S of capacity N
- top is the index of the top element

Write an algorithm for each:

- popping an element from the stack
- pushing an element onto the stack

Array-based Stack Pop & Push Algorithms

Algorithm pop(*S*, *top*)

Input an array *S* of capacity *N*

the index *top* of the top element in the stack

Output the element at the top of the stack

if *top* = -1 then

return "Empty Stack"

else

$top \leftarrow top - 1$

return *S*[*top*+1]

Algorithm push(*S*, *top*, *o*)

Input an element *o* to be added to the stack

an array *S* of capacity *N*

the index *top* of the top element in the stack

if *top* + 1 = *N*

return "Full Stack"

else

$top \leftarrow top + 1$

S[*top*] $\leftarrow o$

Performance

Given n is the number of elements in the stack

- How much space is used?
 - $O(n)$
- What is the runtime complexity of the `push()` and `pop()` algorithms?
 - $O(1)$

QUESTION

What are the limitations of using an array-based stack?

Limitations

- The maximum size of the stack is defined beforehand and cannot change
 - How can you mitigate this limitation?
- Trying to push to a full stack generates an implementation-specific exception
 - How can you mitigate this limitation?

DEFINITION

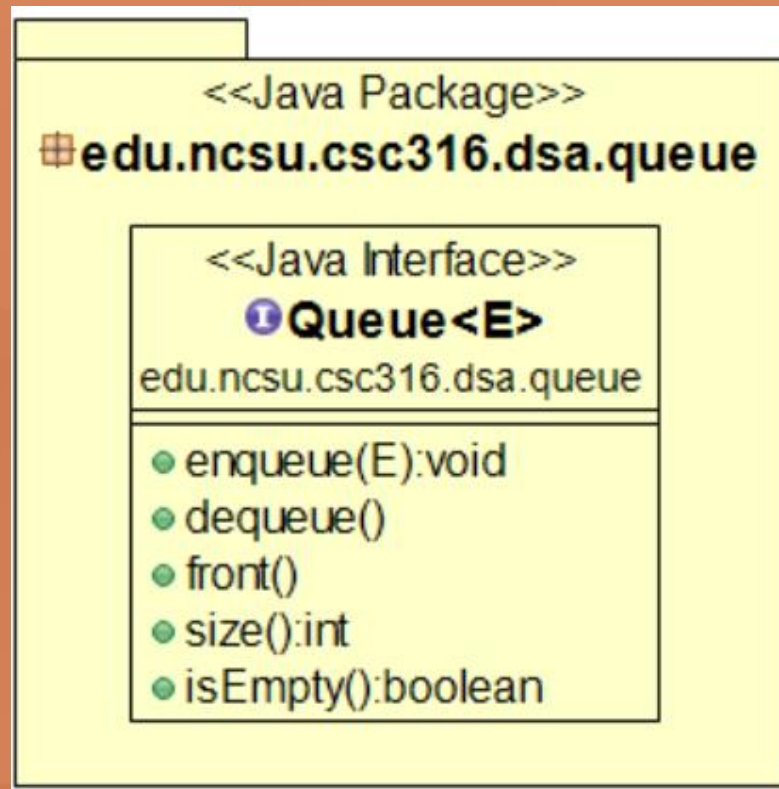

Queue

- Collection of data, where the first value inserted is the first value removed
- FIFO (first-in-first-out)
- Values can only be inserted at the end of the queue, or removed from the front of the queue

ABSTRACT DATA TYPE

Operation	Description
enqueue(e)	Adds the element to the back of the queue
dequeue()	Removes and returns the element at the front of the queue
front()	Returns, but does not remove, the element at the front of the queue
size()	Returns the number of elements in the queue
isEmpty()	Returns true if the queue is empty; otherwise, returns false

ABSTRACT DATA TYPE

Queue with a Singly Linked List

- Use head and tail pointers
- **enqueue(o)**: insert at the tail →
- **dequeue()**: remove at the front →

Array-based Queue Implementation

- Use an array of size N
 - Use the array in a **circular** fashion
- Keep track of the front and rear of the queue
 - *front*: index of the front element
 - *rear*: index immediately past the last element in the queue
- Keep *rear* empty \rightarrow maximum number of values in the queue is $N-1$

Array-based Queue Implementation

Circular Buffer

- Use **mod N** arithmetic to address
- Positions 0 and N-1 are adjacent

Array-based Queue Algorithms

Given:

- an array Q of capacity N
- $front$, the index of the first element in the queue
- $rear$, the index immediately after the last element in the queue

Array-based Queue Dequeue

Algorithm dequeue(*Q*, *front*)

Input an array *Q* of capacity *N*
the index of the front element

Output the element at the front of the queue

if isEmpty() then

return "Empty Queue"

else

o $\leftarrow Q[\textit{front}]$

front $\leftarrow (\textit{front} + 1) \bmod N$

return o

QUESTION

Can you resize an array-based circular buffer?

IMPORTANT

You **cannot** resize an array-based circular buffer like you resize an array-based list.

→ What if the elements “wrap around” the end of the array?

Instead, to resize an array-based circular buffer:

→ Create a larger array

→ Copy elements into the larger array

→ The element at “front” in the old array should go into the new array at index 0

→ Update “front” and “rear” to reflect the new array

Application: Round-Robin Scheduler

Use a queue Q and repeatedly perform these steps:

1. $p = Q.dequeue()$
2. Service process p
3. If process is not complete, $Q.enqueue(p)$

Document Algorithms

- If your algorithm needs to interact with a data structure
 - Your algorithm should **use the ADT operations!**
- When you analyze your algorithm, you can examine tradeoffs in performance of different data structures

Example: Document Algorithm

Write an algorithm `reverse` that takes an input list and reverses the elements in the list.

Algorithm `reverse`(L)

Input a list L of n elements

Output the list of elements in reverse order

S \leftarrow empty stack

while NOT `L.isEmpty()` do

 x \leftarrow `L.remove(0)`

`S.push(x)`

while NOT `S.isEmpty()` do

`L.addLast(S.pop())`

return L

All of these are operations defined by the abstract data types!

Example: Analyze Algorithm

What is the asymptotic running time if:

- input list is an array-based list
- stack is an array-based stack with top at the end

Algorithm `reverse(L)`

Input a list `L` of `n` elements

Output the list of elements in reverse order

`S` \leftarrow empty stack

```
while NOT L.isEmpty() do
    x  $\leftarrow$  L.remove(0)
    S.push(x)
while NOT S.isEmpty() do
    L.addLast( S.pop() )
return L
```

**$O(1)$ isEmpty + $O(n)$ remove + $O(1)$ push
repeated $O(n)$ times**

**$O(1)$ isEmpty + $O(1)$ addLast + $O(1)$ pop
repeated $O(n)$ times**

$O(n^2)$

Operation	Running Time
<code>L.isEmpty()</code>	$O(1)$
<code>L.remove(0)</code>	$O(n)$
<code>S.push(x)</code>	$O(1)$
<code>S.isEmpty()</code>	$O(1)$
<code>S.pop()</code>	$O(1)$
<code>L.addLast(v)</code>	$O(1)$

Example: Analyze Algorithm

What is the asymptotic running time if:

- input list is linked list with pointer at head (no tail)
- stack is a linked stack with top of stack at tail

Algorithm `reverse(L)`

Input a list `L` of `n` elements

Output the list of elements in reverse order

`S` \leftarrow empty stack

```
while NOT L.isEmpty() do
    x  $\leftarrow$  L.remove(0)
    S.push(x)
while NOT S.isEmpty() do
    L.addLast( S.pop() )
return L
```

**$O(1)$ isEmpty + $O(1)$ remove + $O(n)$ push
repeated $O(n)$ times**

**$O(1)$ isEmpty + $O(n)$ addLast + $O(n)$ pop
repeated $O(n)$ times**

$O(n^2)$

Operation	Running Time
<code>L.isEmpty()</code>	$O(1)$
<code>L.remove(0)</code>	$O(1)$
<code>S.push(x)</code>	$O(n)$
<code>S.isEmpty()</code>	$O(1)$
<code>S.pop()</code>	$O(n)$
<code>L.addLast(v)</code>	$O(n)$

Example: Analyze Algorithm

What is the asymptotic running time if:

- input list is circularly linked list with tail pointer
- stack is a linked stack with top of stack at front

Algorithm `reverse(L)`

Input a list `L` of `n` elements

Output the list of elements in reverse order

`S ← empty stack`

`while NOT L.isEmpty() do`

`x ← L.remove(0)`

`S.push(x)`

`while NOT S.isEmpty() do`

`L.addLast(S.pop())`

`return L`

**$O(1)$ isEmpty + $O(1)$ remove + $O(1)$ push
repeated $O(n)$ times**

**$O(1)$ isEmpty + $O(1)$ addLast + $O(1)$ pop
repeated $O(n)$ times**

$O(n)$

Operation	Running Time
<code>L.isEmpty()</code>	$O(1)$
<code>L.remove(0)</code>	$O(1)$
<code>S.push(x)</code>	$O(1)$
<code>S.isEmpty()</code>	$O(1)$
<code>S.pop()</code>	$O(1)$
<code>L.addLast(v)</code>	$O(1)$

REVIEW

- Design and document your algorithms using abstract data types and their associated behaviors
- Select your data structure(s) to optimize algorithm runtime performance
- You may need to consider alternative data structure(s)
